

Screen for Life: Wonder If You Should Get Tested? PSA (:60)

Wonder if you should get tested for colorectal cancer?

Well, it's the second leading cancer killer in the U.S.

And screening helps prevent it. So if you're 50 or older, it's time.

Even if it doesn't run in your family. Most often, colorectal cancer occurs in people with no family history.

And it doesn't always cause symptoms, especially early on. So don't wait for symptoms to get tested.

Screening helps prevent the disease by finding precancerous polyps so they can be removed.

Remove the polyp, prevent the cancer!

Screening also helps find colorectal cancer early... when treatment works best.

You might be thinking – “Oh no, not *that* test.”

But here's the thing—you have options! There's more than one screening test.

Talk to your doctor to find the one that's right for you.

No more excuses. If you're over 50, get tested.

Because colorectal cancer screening really *does* save lives.

A message from HHS and CDC's Screen for Life campaign.
